DIBOSS OR-110 SERVICE NOTES

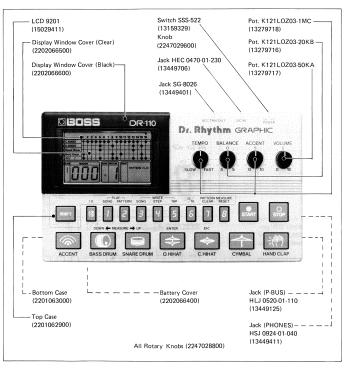

First Edition

SPECIFICATIONS

: 9VDC (battery or AC adaptor) : 7mA (at no signal) to 12mA (max.) @9V

Current Draw

7-1/2(W) x 4-5/16(D) x 1-3/16(H) in : 450g / 1 lb. (including batteries) Weight

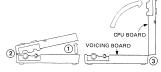

■Roland

Printed in Japan. BE-2

DISASSEMBLY

Exposing PCBs

- Remove 4 rotary knobs.
 Remove 3 x 12mm P type screws on Bottom case.
 Open Top case, first at the rear end ①, gently push rearwards (unlock), then open at the front end ②. Insert a cloth between panels to protect the rear surface of top panel from scratching. This allows troublshooting for both PCBs while maintaining the unit operative from built-in drycells.

Dismounting VOICING Board

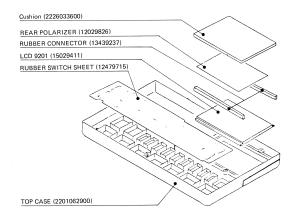

- $\begin{tabular}{ll} 1. & Remove Battery compartment cover and remove the dry cells. \\ 2. & Unlatching Battery clips (4), raise Bottom case. \\ \end{tabular}$

LCD ASSEMBLY

Avoid unnecessary service to LCD Ass'y, When reassembling, make sure that the face (not rear) of Rear Polarizer touches LCD.

The correct layer makes display dark when the LCD and polarizer are placed crosswise.

CIRCUIT DESCRIPTIONS

CPU IC1

 $\mbox{HD44790A44}$ is a 2K word by 4 bit one chip CMOS microcomputer equipped with internal LCD drivers.

CPU HD44790A-44 PIN FUNCTIONS

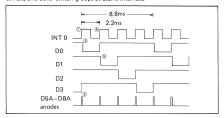

Symbol	Name	Description		
R00				
R01	Input Port	Read in Key switches and TEMPO CLOCK.		
R02	input Port	Head in Key switches and TEMPO CLOCK.		
R03				
R10				
B11		External Memory Data Bus		
R12		(Rhythm patterns A/B, Songs I/II)		
R13	I/O Port			
R20	I) O FOIL			
R21				
R22				
R23		External Memory Address Bus P20—P23: Used as OUTPUT Port		
R30		P20-P23: Used as UU IPU I Port.		
R31	Output Port			
R32				
D0				
D1				
D2		Output Switches and Tempo Clock Scanning signals.		
D3				
D4				
D5		External Memory Address Bus		
D6		WE Memory Write Enable		
D7	Descripte I/O terminals	CS Memory Chip Select		
D8	DOX: SEE IT D COMMISSION	CH		
D9		OH		
D10		SD		
D11		BD 0 T T T T T T T T T T T T T T T T T T		
D12		AC Output Trigger pulse to VOICEs.		
D13		CY		
D14		CPI		
D15		CPII		
INTO	Interrupt Inputs	Interrupt Input for Switch Scanning		
INT 1		OPEN-pulled up internally		
RESET	Reset Input	Accepts 400ms-width pulse on Power-up.		
HLT	Units Income	When "low", the CPU retains all internal		
nul	Halt Input	circuit status as they are.		
TEST	Test Input	No customer usable terminal.		
V1				
V2	LCD DC Supply Inputs	Used as LCD driver signals.		
V3				
Vcc	DC Supply Input	+5V (±10%) also used as LCD DC supply		
GND	Ground Input	GND		
SEG 1				
SEG 32	SEGMENT Outputs	Output LCD drive signals		
COM 1	Common Outputs	Output LCD drive signals in 1/4 duty, 1/3 bias.		

SWITCH MATRIX (See Fig. below)

- ① The CPU enters external interrupt routine on a rising edge of INT CLK from IC2a, b which also serve as a part of CY Sound Generator, and reads in TEMPO CLK and key switches through ports D0-D3 and through R00-R03.
- ② In reading the aboves, the CPU first turns ports D0—D3 "H", cutting off D5A—D8A, D5B—D8B and D1B—D4B, disconnecting the diodes from IC3 NAND gates and the ports R00—R03. With an H being applied on one input pin, each gate of IC3 will turn its output to "L" when the other input pin is H (closing of STOP, START or BANK, or during H period of TEMPO CLK). Ports R00—R03 are pulled up internally and go low when their mate IC3 outputs turn to L.
 ③ Next, the CPU IC1 sets port D0 to "L" which pulls one inputs of IC3
- ③ Next, the CPU IC1 sets port D0 to "L" which pulls one inputs of IC3 down to low, turning all IC3 outputs to "H", reverse biasing D1A-D4A which in turn isolate IC3 from the read-in ports. Each of ports R00-R03 can be connected to port D0 through closed contacts (of CH, OH, SD or PD) and through P0P The the progress patterns the basis being the port of the port
- BD) and through DBB. Then the program returns to the main routine.

 ④ On the next rising edge of INT CLK, the program enters interrupt routine again and gates IC3.
- again and upon the State (CS) outputs, this time the program sets D1 to L and reads SHIFT, CP, CY and AC switches through R0 ports.

The CPU repeats the same procedures for the remaining D ports and returns to ①, cycling TEMPO CLK, STOP, START and BANK readings at 2.2ms internals, and other switch groups at 8.8ms intervals.

MEMORY BACKUP

IC2 μ PD444C is a 1K-word by 4 bits static RAM. It is used in DR-110 for storing BANKs A/B, SONGs I/II and STEPs 12/16 data. (BANKs C/D containing factory-set rhythms are stored into CPU's internal ROM.) The RAM memory is backed up by built-in battery which bypasses power switch and connects to RAM's VCC, \overline{WE} and \overline{CS} pins.

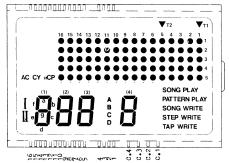

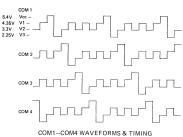

During the power OFF \overrightarrow{HLT} pin of IC1 CPU is kept L, maintaining all its input and output pins high impedance, isolating its circuits from peripheral circuits and thus retains all the data so far obtained. When the CPU is repowered, it intitalizes internal circuits but still keeps some data intact.

LCD

Each segment in LCD has a pair of electrodes. Electrodes on one glass plate are grouped into four common (COM) terminals and the other plate electrodes into SEGs as shown below.

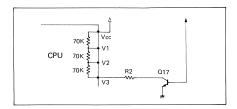

No.	COM.1	COM.2	COM.3	COM.4	No.	COM.1	COM.2	COM.3	COM.4
C.1	COM.1				15	В	19	1b	15-5
C.2		COM.2			16	- 1	1f	1a	16-5
C.3			COM.3		17	16-1	16-2	16-3	16-4
C.4				COM.4	18	15-1	15-2	15-3	15-4
1	TAP W.	4d		1.5	19	14-1	14-2	14-3	14-4
2	STEP W.	4 e	4c	2-5	20	13-1	13-2	13-3	13-4
3	SONG W.	4g	4b	3-5	21	12-1	12-2	12-3	12-4
4	PAT. P.	41	4a	4-5	22	11-1	11-2	11-3	11-4
5	SONG P.	3d		5-5	23	10-1	10-2	10-3	10-4
6	D	3e	3c	6-5	24	9-1	9-2	9-3	9-4
7	С	3g	3b	7-5	25	8-1	8-2	8-3	8-4
8	В	31	3a	8-5	26	7-1	7-2	7-3	7-4
9	A	2d		9-5	27	6-1	6-2	6-3	6-4
10	T1	2e	2c	10-5	28	5-1	5-2	5-3	5-4
11	T2	2g	2b	11-5	29	4-1	4-2	4-3	4-4
12	AC	2f	2a	12-5	30	3-1	3-2	3-3	3-4
13	CY	1d		13-5	31	2-1	2-2	2-3	2-4
14	CP	1e	1c	14-5	32	1-1	1-2	1-3	1-4

The LCD operates dynamically in 1/4 duty cycles and 1/3 bias. Each segment reads out when its COM terminal receives 2.25V(V3) and SEG terminal 5.4V (VCC) $\cdot\cdot\cdot$ this voltage difference will provide the sharp edged, most visible readout.

When the DC supply drops, Q17 increases resistance, further decreasing potential difference between COM and SEG terminals, which causes the readout duller. This effectively functions as a battery indicator.

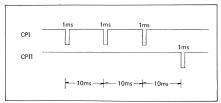

TRIG OUT

Ports D8-D15 of the CPU are normally at +6V and go to 0V for 1ms when triggering designated voice

- ACC TRIG AC TRIG pulse passing D9 is lengthened and inverted to become positive 10ms-wide pulse and is routed to ACC TRIG OUT jack.
- The AC TRIG pulse passing through Q18 conducts Q20 and Q21 until its fall time determined by the time constant, connecting ACCENT VR3 in parallel with audio ACCENT
- signal path.

 For Hand Clap two trigger pulses of different timing are provided to simulate reverbration effect. HAND CLAP -

NOISE GENERATOR

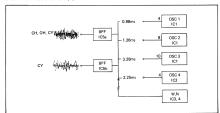

IC3 and IC4 are configured to function as a quasi-random impulse generator, a generation of a succession of random signals which are distributed over a wide frequency spectrum. On power-up, Power-ON Reset circuit turns pin 1 of IC3 H as a data "1". Because the shift register will not operate when its all D pins are at 0.

NOTE: Intermitent DC supply (such as loose AC adaptor or battery connection or quick turning OFF-ON of the power switch) may upset Power-ON Reset when a transient of DC voltage is shorter than the time constant of RESET circuit. The resultant will be loss of noise sound.

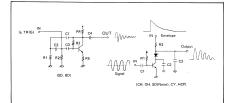

CY SOUND GENERATOR

Four generators oscillate at different frequencies which are determined based on analyses of live symbal sounds. Interrelations between frequencies are so critical that slight deviation of one frequency can cause beat sound or distortion. To let the generators stay in a specific frequency, C1, C4, C12 and C13 should be less than 5%(J) of tolerance.

VOICE GENERATORS

The voice generators are categorized into two groups: Damping oscillator for drum sound and a combination of Swing type VCA and Envelope generator for metalic sounds.

TEST PROGRAM

The CPU is equipped with TEST program for checking LCD and Switch Reading functions.
To enter the test program, press and hold START and STOP buttons and turn

the power switch ON.

LCD CHECK - All readouts will be displayed in slightly dull black - because

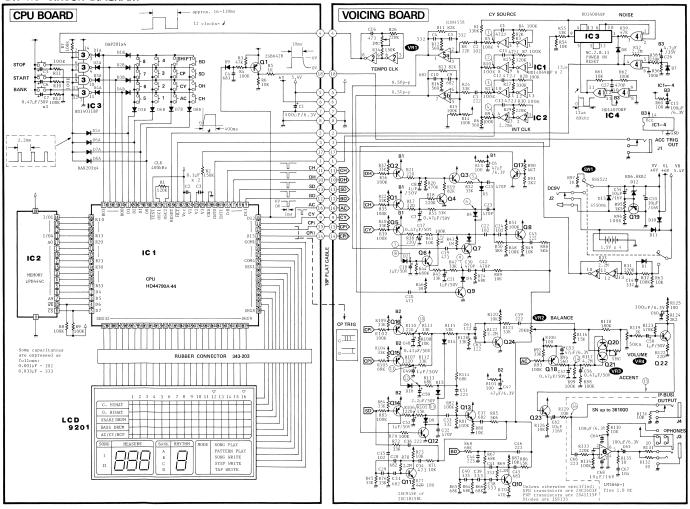

LCD drivers are being overloaded.

Check for lack of segment against the illustration and table in LCD section of the Circuit Description.

SWITCH READING - Press all key switches one by one in any order. Letters "OK" will appear upon pressing the last key, indicating all the keys pressed have been read by the CPU.

VOICING BOARD

7313204006 (pcb 2291084300) SN up to 361000

7313204009 (pcb 2291084302) SN 371100-up

CHANGE INFORMATION (VOICING BOARD)

- * 011: from 2SC2603F to 2SC945K, 2SC1815BL or 2SC2603G * R77: from 120 to 180ohms.

- * R77: from 120 to 1800hms.

 *IC5: from TL022CP to NJM4558DD

 Reason TL022CP would cause thilet ro oscillate

 *ID13: from ISS133 to SS500G (higher forward current type)

 Reason Plugging a high voltage/current AC adaptor of reverse polarity
 may destroy 1SS133.

 *IC6: from LM386N-1 to M51501L (incompatible) with PCB relaid out.

 Reason IC procurement problem.

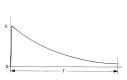

SN 371100-up
